IPDPS • 23-27.5.2016

23rd Reconfigurable Architectures Workshop

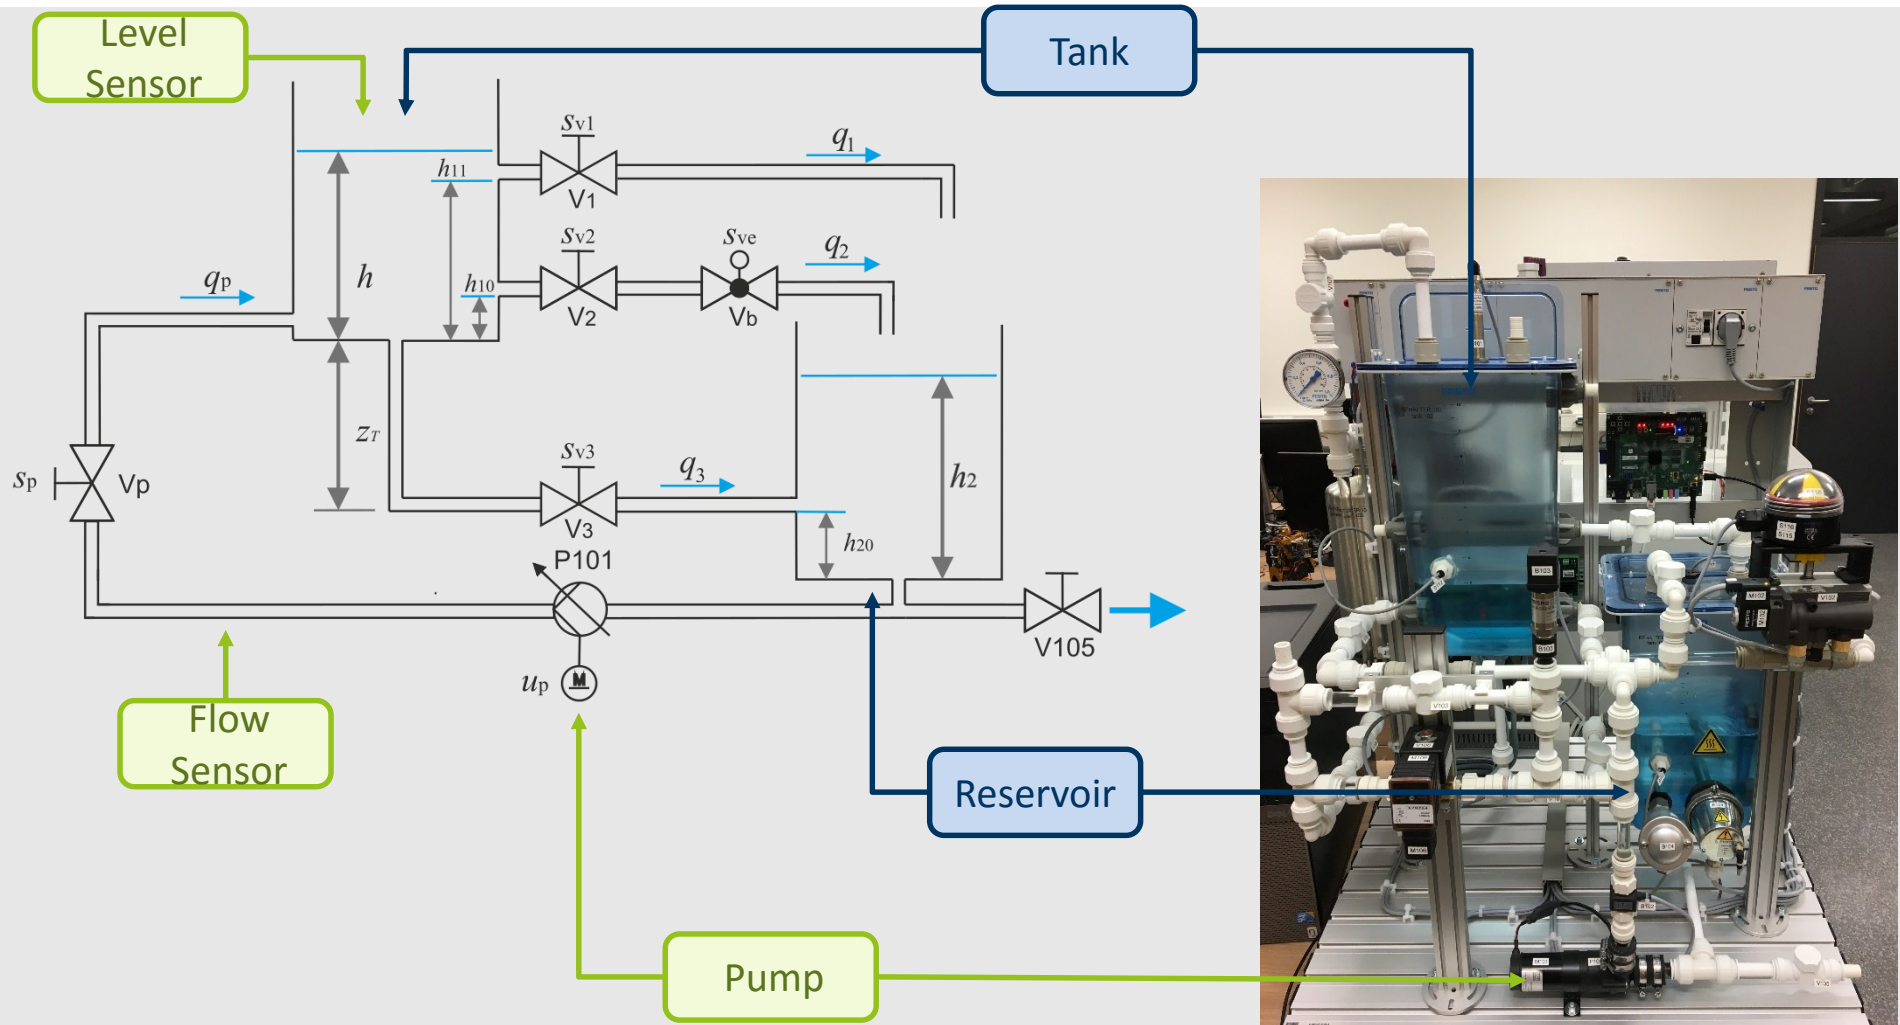

Motivation

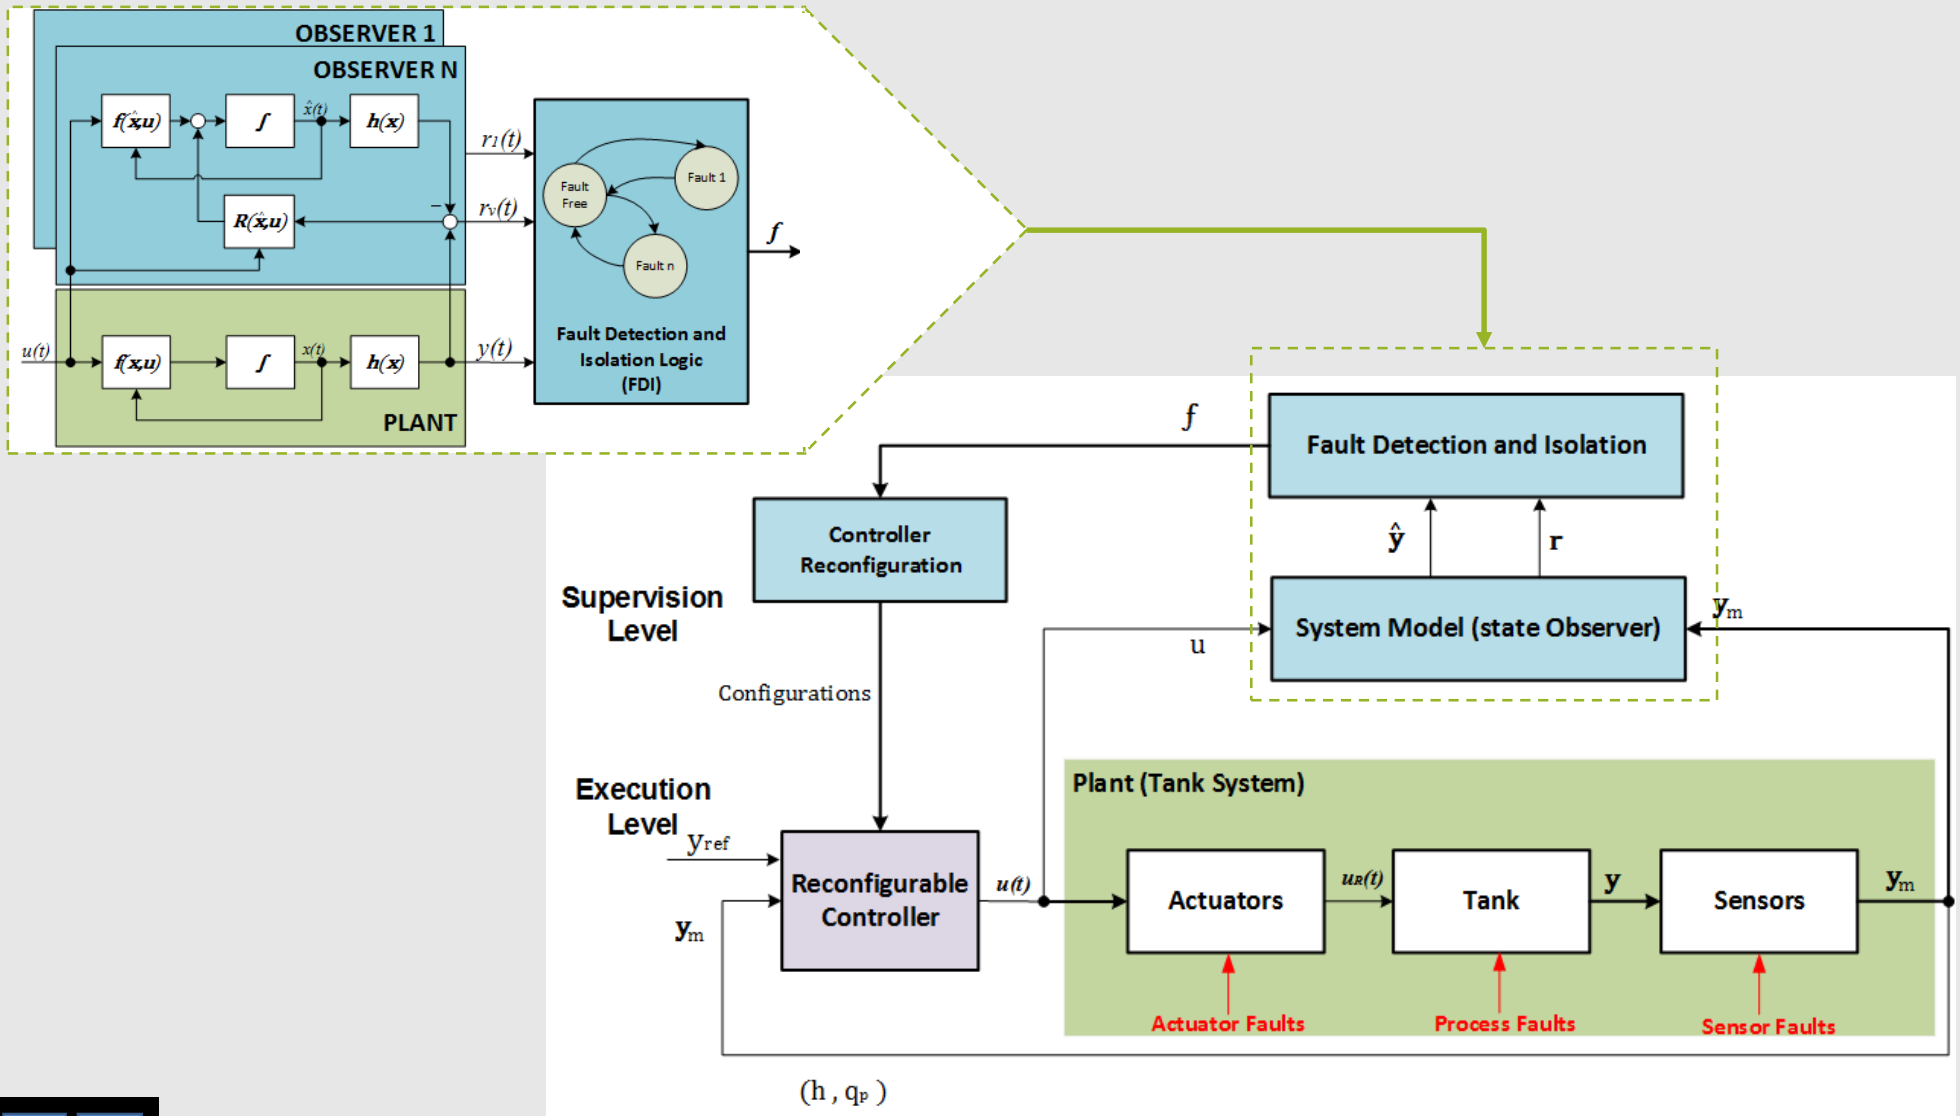

- Control System Design
 - Usually done in Mathworks Matlab
 - Critical component that should be fault tolerant
- Hardware/Software Co-Design for Fault-Tolerant Controller
 - High-Level Synthesis based development flow approach
 - Seamless control algorithm reallocation between hardware and software domain
 - Load balacing during run-time
 - Handling of faulty components

Evaluation

- Cycle time 100ms
 - Dynamic reallocation during run-time
- Resource usage
 - PS: ~3% (workload), Slices: 5% , BRAM: 0% , DSP48E1: 2%
